## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 7483 was prepared by Technical Committee ISO/TC 5, *Ferrous metal pipes and metallic fittings*, Sub-Committee SC 10, *Metallic flanges and their joints*.

Annexes A and B of this International Standard are for information only.

## Dimensions of gaskets

### Introduction

This International Standard has been prepared in order to specify dimensions of gaskets for use with flanges to the following standards:

ISO 7005-1, *Metallic flanges — Part 1: Steel flanges*

ISO 7005-2, *Metallic flanges — Part 2: Cast iron flanges*

ISO 7005-3, *Metallic flanges — Part 3: Copper alloy and composite flanges*

It is divided into sections, according to the form of gasket, as follows:

Section 1: General

Section 2: Non-metallic flat gaskets

Section 3: Spiral wound gaskets

Section 4: Metallic ring-joint gaskets

Section 5: Non-metallic envelope gaskets

Section 6: Corrugated, flat or grooved metallic and filled metallic gaskets

The materials for gaskets are outside the scope of this International Standard but section 1 lists the various forms of gaskets and the ranges of materials used for some gasket forms, and section 4 gives hardness values of typical ring-joint gasket materials.

The selection of the gasket type, its material and thickness (as applicable) should take account of the operating conditions, the properties of the gasket material, the type of flange facing, the surface finish of the flange and the flange bolt loading. Therefore, it is recommended that the selection of gaskets for any particular application is made in consultation with the gasket supplier.

Annex A lists for information the type of flange faces for which gaskets are specified in this International Standard and annex B gives information to be supplied by the purchaser when ordering gaskets.

# Dimensions of gaskets for use with flanges to ISO 7005

## Section 1: General

### 1.1 Scope

This International Standard specifies the dimensions of the following gaskets for use in conjunction with flanges to ISO 7005-1, ISO 7005-2 and ISO 7005-3 (see 1.4):

- a) non-metallic flat gaskets;
- b) spiral wound gaskets;
- c) metallic ring-joint gaskets;
- d) non-metallic envelope gaskets;
- e) corrugated, flat or grooved metallic and filled metallic gaskets.

NOTE 1 A future part of ISO 7005 will cover aluminium and aluminium alloy flanges.

The relevant nominal size (DN) and nominal pressure (PN) ranges for each form of gasket are given in sections 2 to 6, as appropriate.

It does not cover the materials for gaskets (see the Introduction).

### 1.2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of ap-

plying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 468:1982, *Surface roughness — Parameters, their values and general rules for specifying requirements.*

ISO 6708:1980, *Pipe components — Definition of nominal size.*

ISO 7005-1:1991<sup>1)</sup>, *Metallic flanges — Part 1: Steel flanges.*

ISO 7005-2:1988, *Metallic flanges — Part 2: Cast iron flanges.*

ISO 7005-3:1988, *Metallic flanges — Part 3: Copper alloy and composite flanges.*

ISO 7268:1983, *Pipe components — Definition of nominal pressure.*

ASTM A 182/A 182M - 87a, *Forged or rolled alloy-steel pipe flanges, forged fittings, and valves and parts for high-temperature service.*

### 1.3 Definitions

For the purposes of this International Standard, the definitions of nominal size (DN) given in ISO 6708 and nominal pressure (PN) given in ISO 7268 apply.

### 1.4 Gasket forms

The forms of gaskets specified in this International Standard are described and illustrated in table 1.

1) To be published.

Table 1 — Gasket forms

Gasket	Sketches	See section	Gasket	Sketches	See section
Rubber, without fabric		2	Ring joint (octagonal)		4
Rubber, with fabric insertion			Ring joint (oval)		
Rubber, with fabric insertion/wire reinforcement			Envelope		5
Plastic material					
Expanded graphite, with or without insertion					
Compressed fibre, with a suitable binder for the operating conditions (see note 1)					
Vegetable fibre			Corrugated metal with filler or corrugated metal jacketed with filler		6
Cork based	Corrugated metal				
Spiral wound, with centring ring and inner ring		3	Grooved metal with or without a layer of additional gasket material		
Spiral wound, with centring ring			Flat metal jacketed with filler		
Spiral wound sealing element with inner ring					
Spiral wound sealing element only			Solid flat metal		

**WARNING — Materials containing asbestos may be subject to legislation that requires precautions to be taken when handling them to ensure that they do not constitute a hazard to health.**

NOTES

- 1 The types of flange facings are specified in ISO 7005-1, ISO 7005-2 and ISO 7005-3, and, for information, the facings are shown in annex A.
- 2 Information which should be supplied by the purchaser when ordering gaskets is listed in annex B.

## Section 2: Non-metallic flat gaskets

### 2.1 Gasket designs

Gaskets shall be manufactured from either

- a) single flat sheet, or
- b) laminated ply,

in a single material or combination of materials.

NOTE 2 Examples of typical materials are given in table 1.

**WARNING** — Compressed fibre gaskets may contain asbestos. Materials containing asbestos may be subject to legislation that requires precautions to be taken when handling them to ensure that they do not constitute a hazard to health.

Figure 1 — Type A flange facings with full face gasket

### 2.2 Gasket types

Gaskets shall be one of the following types:

- a) full face gasket for type A (flat face) or type B (raised face) flange facings [see figures 1 and 5a];
- b) IBC (inside bolt circle) gasket for type A (flat face) or type B (raised face) flange facings [see figures 2 and 5b)];
- c) tongue and groove gasket for type C/D flange facings [see figures 3 and 5b)];
- d) spigot and recess gasket for type E/F flange facings [see figures 4 and 5b)];
- e) segmental gasket (see note 3 below).

NOTE 3 Gaskets of the types described in a), b), c) and d) and having an outside diameter greater than 1 500 mm may be available only in segmental form. The purchaser should consult the gasket manufacturer or supplier as to the forms available for the larger sizes of gasket.

NOTE — For PN 20, PN 50, PN 110 and PN 150 the IBC gasket extends to touch the bolt.

Figure 2 — Type B flange facings with IBC gasket

Figure 3 — Type C/D flange facings with tongue and groove gasket

Figure 4 — Type E/F flange facings with spigot and recess gasket

### 2.3 Range of gasket sizes

The ranges of sizes of gaskets to suit the nominal sizes (DN) and nominal pressures (PN) of flanges are given in table 2 for the different gasket types.

### 2.4 Dimensions

#### 2.4.1 Thickness

Gasket thicknesses for non-metallic flat gasket materials given in table 1 shall be selected from table 3.

#### 2.4.2 Diameters

The dimensions for diameters shall be as given in tables 4 to 11, as appropriate; the plan dimensions are shown in figure 5.

Table 2 — Range of gasket sizes

Flange nominal pressure  PN	For dimensions refer to table number	Gasket type							
		Full face		IBC		Tongue and groove		Spigot and recess	
		Range of nominal sizes DN							
		from	to	from	to	from	to	from	to

1) Except tongue and groove gaskets.

### Section 3: Spiral wound gaskets

#### 3.1 Gasket designs

Spiral wound gaskets shall be one of the following designs:

- sealing element with centring ring and inner ring;
- sealing element with centring ring only;
- sealing element with inner ring only;
- sealing element only.

NOTE 4 Examples of the designs are given in table 1.

**WARNING** — Spiral wound gaskets may contain asbestos. Materials containing asbestos may be subject to legislation that requires precautions to be

taken when handling them to ensure that they do not constitute a hazard to health.

Figure 6 shows a typical design of a spiral wound gasket; for use with type A or type B flange facings, the sealing element shall be designed to fit the appropriate centring ring given in table 12. The clearance between the sealing element and the centring ring shall be such that the sealing element cannot fall out of the ring during normal handling.

#### NOTES

5 The profile of the metal winding of the sealing element is at the option of the manufacturer.

6 The materials of the gasket are chosen by the manufacturer to suit the operating conditions. Therefore, it is incumbent upon the purchaser to define the operating conditions in the enquiry and/or order.

Figure 6 — Typical design of a spiral wound gasket with centring ring and inner ring for use with a type B flange facing for sizes up to and including DN 1000

### 3.2 Gasket designs according to flange facing

#### 3.2.1 For type A (flat face) or type B (raised face) flange facings

The gaskets shall have a centring ring. All PN 150, PN 260 and PN 420 gaskets and all gaskets containing polytetrafluoroethylene (PTFE) filler material shall have an inner ring.

##### NOTES

7 The use of an inner ring is recommended for PN 20, PN 25, PN 40, PN 50 and PN 110 gaskets. Inner rings may be fitted also to gaskets for use with PN 10 and PN 16 flanges.

8 The purchaser should specify in the order and/or enquiry if an inner ring is required for PN 10, PN 16, PN 20, PN 25, PN 40, PN 50 or PN 110 gaskets.

9 Figure 7 shows two types of gaskets for use with type A or type B flange facings.

#### 3.2.2 For type C/D (tongue and groove) flange facings

The sealing element only shall be used (see figure 8).

#### 3.2.3 For type E/F (spigot and recess) flange facings

The sealing element only or the sealing element with inner ring shall be used (see figure 9).

NOTE 10 The purchaser should specify in the enquiry and/or order if an inner ring is required.

### 3.3 Marking

The centring ring shall be marked with the following information:

- the number of this International Standard, i.e. ISO 7483;
- the manufacturer's name or trade-mark;
- the nominal size, i.e. DN followed by the appropriate number;
- the nominal pressure, i.e. PN followed by the appropriate number;
- the manufacturer's symbols for the metal winding and filler material.

### 3.4 Dimensions

Gaskets for type A and type B flange facings shall have the dimensions specified in table 12, as appropriate, and the overall thickness (including filler) shall be in accordance with figure 6 or shall not exceed 5,2 mm for sizes up to and including DN 1000. For sizes above DN 1000, the overall thickness shall not exceed 7,5 mm.

NOTE 11 Thicknesses given in figure 6 are preferred dimensions for sizes up to and including DN 1000.

Gaskets for type C/D and E/F flange facings shall have dimensions suitable for flange facings shown in figure 10 and given in table 13, as appropriate.

Gaskets having an inner ring for type E/F flange facings [see figure 9b)] shall have an inner ring minimum internal diameter as specified in table 12, as appropriate.

## NOTES

- 1 Y is the recess outside diameter, Z is the recess inside diameter, and  $f_3$  is the recess depth.
- 2 Inside and outside diameters of gaskets to suit these dimensions will depend on the characteristics of individual manufacturer's gaskets.

## Section 4: Metallic ring-joint gaskets

### 4.1 Gasket designs

Metallic gaskets for use with type J, ring-joint, flange facings shall have a cross-sectional shape which is either

- a) octagonal, or
- b) oval.

#### NOTES

12 Figure 11 shows flange joints illustrating both octagonal and oval ring-joint gaskets.

13 If the purchaser requires a ring-joint gasket with a particular cross-sectional shape, then this requirement should be stated in the enquiry and/or order.

### 4.2 Dimensions and tolerances

4.2.1 Metallic ring-joint gaskets shall have the dimensions as specified in table 14 and figure 12.

NOTE 14 Dimensions of grooves and gaskets are such that, when joints are assembled, the flanges are apart and the approximate distances which the flanges are apart for each nominal pressure (PN) designation are given in the appropriate table of ISO 7005-1.

4.2.2 The tolerances on dimensions (as shown in figure 12) shall be as specified in table 15.

NOTE 15 The presence of a small forging fin, located so that it does not prevent the ring from seating properly in the groove, is acceptable.

### 4.3 Surface texture

When compared by visual or tactile means with reference specimens, the surface texture of the 23° surfaces of octagonal gaskets and the contact faces of oval gaskets shall be in accordance with the values specified in table 16.

NOTE 16 It is not intended that instrument measurements be taken on the faces themselves; the  $R_a$  and  $R_z$  values as defined in ISO 468 relate to the reference specimens.

### 4.4 Identification number

Identification numbers, prefixed by the letter R, as specified in table 14 shall be assigned to metallic ring-joint gaskets.

### 4.5 Marking

The outer surface of each gasket shall be marked with the following:

- a) the manufacturer's name or trade-mark;
- b) the gasket identification number prefixed by the letter R (see 4.4);
- c) the material identification.

Where a material is used that is listed in 4.6, then the material identification symbol given shall be used. The application of marking shall not damage the contact faces or otherwise harmfully distort the gasket.

Figure 11 — Details of metallic ring-joint gaskets as housed

$R_1 = 1,6 \text{ mm}$  for ring widths  $A < 22,3 \text{ mm}$

$R_1 = 2,4 \text{ mm}$  for ring widths  $A > 22,3 \text{ mm}$

1) For ring joints with loose hubbed flanges for lapped pipe ends (type 15 flanges) only.  
2) For flanges other than loose hubbed flanges for lapped pipe ends

Table 15 — Dimensional tolerances

Symbol	Designation	Tolerance
<i>P</i>	Average pitch diameter of ring	± 0,18 mm
<i>A</i>	Width of ring	± 0,2 mm
<i>B</i> and <i>H</i>	Height of ring <sup>1)</sup>	± 0,4 mm
<i>C</i>	Width of flat of octagonal ring	± 0,2 mm
	Angle 23°	± 0,5°
<i>R</i> <sub>1</sub>	Radius of ring	± 0,4 mm

1) A plus tolerance of 1,2 mm for heights *B* and *H* is permitted provided that the variation in the height of any given ring does not exceed 0,4 mm throughout its entire circumference.

Table 16 — Surface texture of ring faces

Values in micrometres

<i>R</i> <sub>a</sub>	<i>R</i> <sub>z</sub>
≤ 1,6	≤ 6,3

NOTE — *R*<sub>a</sub> and *R*<sub>z</sub> are defined in ISO 468

## 4.6 Typical materials for metallic ring-joint gaskets

Typical materials used for metallic ring-joint gaskets are specified in table 17 together with their recommended maximum hardness values. Where a material listed is used, the identification symbols given shall be used for marking purposes as appropriate (see 4.5).

NOTE 17 The materials used for the gaskets should have a hardness value lower than that of the flange material to ensure tight joints. However, it may not be possible for the hardness values of metallic ring-joints to be lower than those of the flange for some alloys. For example, stainless steel alloy flanges, heat-treated for optimum corrosion resistance, will have the same range of hardness as gaskets made of the same material and annealed to minimum hardness.

Table 17 — Hardness values and material identification symbols for ring-joint gaskets

Metallic ring-joint gasket material	Recommended maximum hardness		Identification symbol
	Brinell <sup>1)</sup> HB	Rockwell <sup>2)</sup> HRB	
Soft iron	90	56	D
Low-carbon steel	120	68	S
4 % to 6 % chromium/0,5 % molybdenum steel	130	72	F5 <sup>3)</sup>
Type 410 steel	170	86	S410
Type 304 steel	160	83	S304
Type 316 steel	160	83	S316
Type 321 steel	160	83	S321
Type 347 steel	160	83	S347
Type 316Ti steel	160	83	S316Ti

1) Brinell hardness measured with 3000 kg load, except for soft iron which is measured with 500 kg load.  
 2) Rockwell B hardness measured with 100 kg load and 1,59 mm diameter ball.  
 3) F5 identification designates ASTM A 182/A 182M - 87a chemical composition requirements only.

## Section 5: Non-metallic envelope gaskets

### 5.1 Gasket designs

Non-metallic envelope gaskets shall be of one of the designs shown in figure 13.

#### NOTES

18 Gasket envelopes are usually manufactured from PTFE and the inserts are usually manufactured from compressed fibre sheet jointings, including asbestos. Other materials are also used to suit particular applications.

**WARNING** — Materials containing asbestos are subject to legislation that requires precautions to be

taken when handling them to ensure that they do not constitute a hazard to health.

19 Each design is applicable only to certain nominal sizes (DN) and nominal pressures (PN) of flanges and is dependent upon manufacturing constraints.

### 5.2 Gasket applications

Gaskets shall be suitable for use with type A (flat face) or type B (raised face) flange facings.

### 5.3 Dimensions

The dimensions of non-metallic envelope gaskets shall be as specified in table 18.

Figure 13 — Non-metallic envelope gaskets

## Section 6: Corrugated, flat or grooved metallic and filled metallic gaskets

### 6.1 Gasket designs

Gaskets shall be one of the following designs:

- a) corrugated metal with filler or corrugated metal jacketed with filler;
- b) corrugated metal;
- c) grooved metal with or without a layer of additional gasket material;
- d) flat metal jacketed with filler;
- e) solid flat metal.

**WARNING** — Corrugated metal gaskets with filler or corrugated metal jacketed gaskets with filler, grooved metal gaskets with or without a layer of additional gasket material and flat metal jacketed gaskets with filler may contain asbestos. Materials containing asbestos are subject to legislation that requires precautions to be taken when handling

them to ensure that they do not constitute a hazard to health.

**NOTE 20** The materials of the gasket are chosen by the manufacturer to suit the operating conditions. Therefore, it is incumbent upon the purchaser to define the operating conditions in the enquiry and/or order.

### 6.2 Gasket types

Gaskets shall be suitable for use with type A (flat face) or type B (raised face) flanges (see figure 14) and shall be one of the following types:

- a) self-centring;
- b) incorporating a centring ring.

### 6.3 Dimensions

The dimensions of corrugated, flat or grooved metallic and filled metallic gaskets shall be as specified in table 19.

a) Self-centring gasket

b) Gasket incorporating a centring ring

**NOTE** — Type B, raised face flanges are shown.

**Figure 14** — Gaskets for type A or type B flange facings

1) The gasket outside diameter is equal to the bolt circle diameter minus the bolt diameter.

**Annex A**  
(informative)

**Flange facing types**

Figure A.1 shows the types of flange faces specified in ISO 7005-1, ISO 7005-2 and ISO 7005-3.

NOTE 21 See the relevant part of ISO 7005 for the particular flange facing types.

**Figure A.1 — Flange facing types specified in ISO 7005-1, ISO 7005-2 and ISO 7005-3**

## Annex B (informative)

### Information to be supplied by the purchaser

The following information should be supplied by the purchaser when ordering gaskets to this International Standard.

#### B.1 General

- a) the number of this International Standard, i.e. ISO 7483;
- b) the form of gasket (see sections 2 to 6);
- c) the nominal size, e.g. DN 100;
- d) the nominal pressure, e.g. PN 25;
- e) the expected operating conditions (see the Introduction);

#### B.2 For non-metallic flat gaskets

In addition to the general information specified in B.1, the following information should be supplied:

- a) the gasket type (see 2.2);
- b) the thickness (see table 3 and the Introduction);
- c) the material (see the Introduction).

#### B.3 For spiral wound gaskets

In addition to the general information specified in B.1, the following information should be supplied:

- a) the design of gasket (see 3.1);
- b) whether an inner ring is required for PN 10, PN 16, PN 20, PN 25, PN 40, PN 50 or PN 110

gaskets for type A or type B flange faces (see 3.2.1);

- c) whether an inner ring is required for type E/F flange facing gaskets (see 3.2.3).

#### B.4 For metallic ring-joint gaskets

In addition to the general information specified in B.1, the following information should be supplied:

- a) whether an octagonal or oval cross-sectional shape is required (see 4.1);
- b) the ring identification number (see table 14);
- c) the material (see 4.6).

#### B.5 For non-metallic envelope gaskets

In addition to the general information specified in B.1, the following information should be supplied:

- a) the design of gasket (see 5.1);
- b) the material (see the Introduction).

#### B.6 For corrugated, flat or grooved metallic and filled metallic gaskets

In addition to the general information specified in B.1, the following information should be supplied:

- a) the design of gasket (see 6.1);
- b) the type of gasket (see 6.2).
